

32

a liquid crystal display for generating a display light of information,
said display light having a plane of polarization inclined by an angle of about 45°
relative to a vertical axis of an image plane of said liquid crystal display;

a first optical rotation layer disposed to a first surface of said
transparent plate, said optical rotation layer being adapted to optically rotate the
plane of polarization of the display light incident thereon by an angle of about 90° ,
the display light from said first optical rotation layer being reflected from a second
surface of said transparent plate and directed toward an eye of an operator; and

a second optical rotation layer disposed between the image plane of
said liquid crystal display and a third surface of said transparent plate, said second
optical rotation layer being adapted to optically rotate the plane of polarization of
the display light from the liquid crystal display by an angle of about 45° and to
allow P-polarized light to emanate toward said first optical rotation layer at
Brewster's angle.

32

4. (Amended) A display system as claimed in Claim 3, further
comprising a light-transmittable reflection layer disposed on said second surface of
said transparent plate, the display light passed through said transparent plate
being reflected on said light-transmittable reflection layer and directed toward the
eye of the operator.

REMARKS

It is noted with appreciation that claims 5 and 6 are deemed allowable.

Favorable consideration and allowance are respectfully requested for claims 1-4 in
